

In July 2007, Tower started using EasyCo MFT drives on Linux servers after years of using 15k rpm SCSI arrays. Our application is both transaction and reporting intensive. We experience peak loads on our servers which can quickly overwhelm a traditional drive system. The MFT drives have dramatically improved the responsiveness of our application. We now have four systems installed and each site is experiencing the same improvements. The first system we implemented was a pre-existing customer with 80 users. They, as well as our other clients are delighted with the improved performance.
